

# ECS Documentation

## Overview

The Custom Entity-Component System (ECS) in MyGame provides a dynamic composition and behavior as well as a good performance for a big amount of entities in a scene.

## Custom types

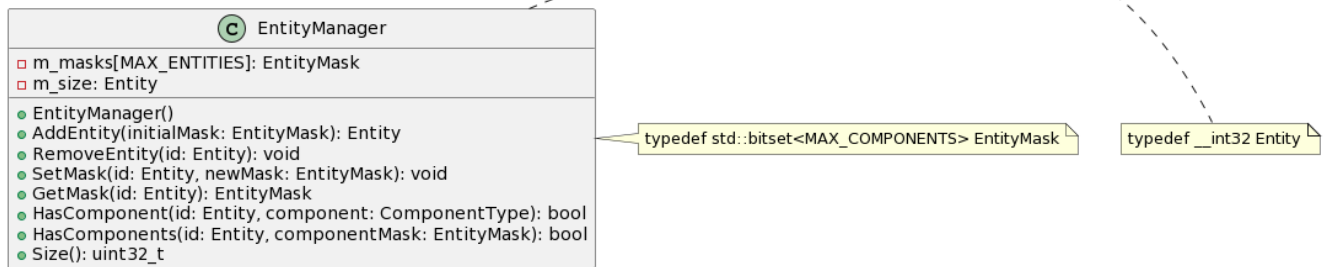

1. **ComponentType** It is an alias for `uint8_t`, representing the type or category of a component. Each component type has a unique identifier within the ECS.
2. **ComponentId** It is an alias for `uint32_t`, serving as a unique identifier for individual instances of components. Each component instance is assigned a unique ID.
3. **Entity** The Entity alias for `__int32` represents the unique identifier for an entity within the ECS. Entity id less than 0 are invalid.
4. **EntityMask** EntityMask is a bitset representing which components are attached to an entity. Each bit corresponds to a specific component type.
5. **Array sizes** `MAX_COMPONENTS` and `MAX_ENTITIES` define the maximum number of component types and entities supported within the ECS.

## Classes

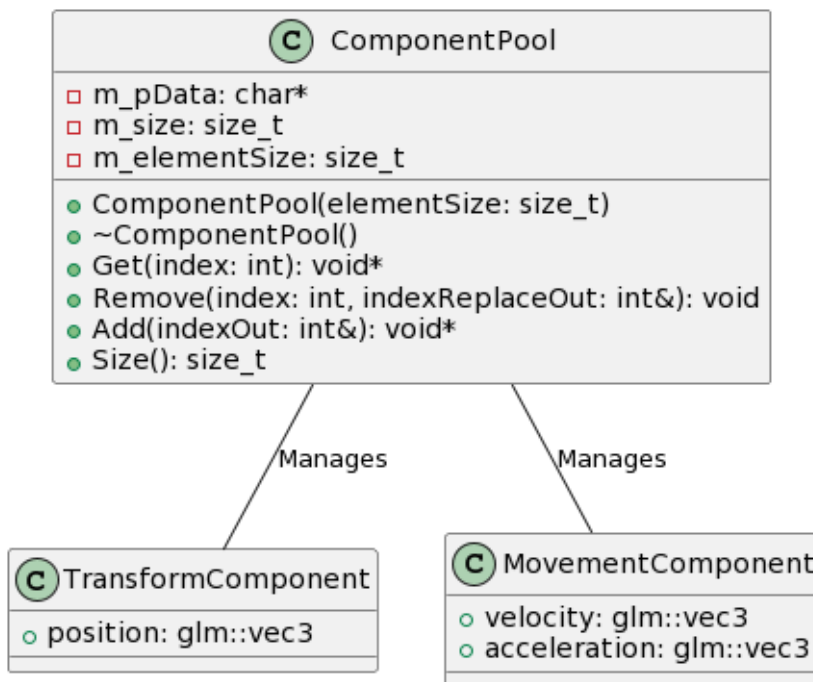

1. **Scene** The Scene class serves as the entry point for managing entities and the component pools and mapping of entity to component. It provides methods for creating and removing entities, adding components, and retrieving components. Additionally, it handles the destruction of entities at the end of a frame.

 Scene
<ul style="list-style-type: none"> <li>❑ <code>EntityManager* m_entityManager</code></li> <li>❑ <code>std::unordered_map&lt;ComponentType, BiMap&lt;Entity, ComponentId&gt;*&gt; m_componentMaps</code></li> <li>❑ <code>std::unordered_map&lt;ComponentType, ComponentPool*&gt; m_componentPools</code></li> <li>❑ <code>int m_componentCounter</code></li> <li>❑ <code>std::vector&lt;Entity&gt; m_entitiesToDestroy</code></li> </ul>
<ul style="list-style-type: none"> <li>● <code>CreateEntity(): Entity</code></li> <li>● <code>RemoveEntity(entityId: Entity): void</code></li> <li>● <code>GetComponentType&lt;T&gt;(): ComponentType</code></li> <li>● <code>AddComponent&lt;T&gt;(entityId: Entity): T*</code></li> <li>● <code>Get&lt;T&gt;(entityId: Entity): T*</code></li> <li>● <code>DestroyEntities(): void</code></li> </ul>

2. **EntityManager** The EntityManager class is responsible for managing entities, their masks, and components.

3. ComponentPool The ComponentPool class manages the storage and retrieval of components of a specific type, It is responsible for keeping the array of components dense, this way the processor doesn't have to jump over multiple locations for retrieving the components data, the full array will be on cache already when the system iterates over it.

## Tests

All the needed tests are on the respective TEST\_ projects, and also an additional benchmark test BENCHMARK\_Scene to validate the performance of the ECS in case of a big number of entities.
